

Graph Mining CSF426  
Lab session 14  
Time: 2 pm - 4pm  
Date: 16-09-2023  
Instructor IC - Vinti Agarwal

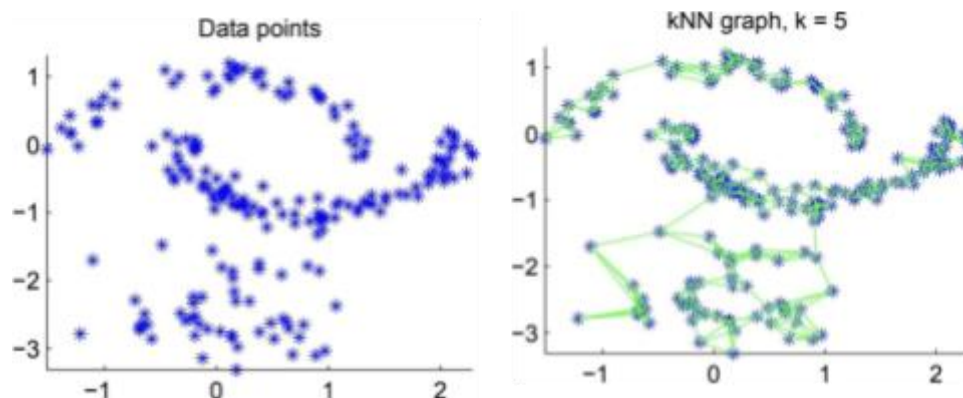

Instructions: All questions need to be answered. **You are required to write programs in jupyter notebook and submit .ipynb.** For theoretical questions, you can type answers in the jupyter notebook itself. There is no need to create a separate text file.

*Note: You are allowed to use your previous code from previous lab sessions for data and part c.*

**[Total Marks =10]**

- a) Create a similarity graph based on *k-nearest neighbor* approach (a reference paper is uploaded on canvas, see page no. 03) and display its variation on different values of *k* between 2 to 5. (An example data and corresponding 5-NN graph are shown below on some other dataset). You are free to choose your own similarity/distance metric (preferably depending on the domain the data comes from), and no general advice will be given. **[3 marks]**

*Note: (For drawing graphs in 2-d plane depicting edges between points, students are allowed to seek help from TAs).*

- b) Construct the weighted adjacency matrices for the k-NN similarity graph on varying values of *k* i.e. 2, 3, 4 and 5 and plot the sparsity level of graph (in %) vs *k*. **[3 marks]**

- c) Design a spectral clustering algorithm for the 2 moons data using the similarity graph for different values of  $k$  i.e. 2, 3, 4, and 5, created in the last lab session. Display the clustering results by selecting different colors for the data points belonging to different clusters. **[4 marks]**
